

**In the Drawings**

- [c1] (Presently Amended, Once) A method for obtaining nuclear magnetic resonance measurements in a wellbore, comprising:  
inducing a static magnetic field in a fluid sample, the static magnetic field being primarily inhomogeneous in the fluid sample;  
applying an oscillating magnetic field to the fluid sample according to a preparation pulse sequence that comprises a J-edit pulse sequence for developing J modulation; and  
acquiring the nuclear magnetic resonance measurements using a detection sequence, wherein the detection sequence comprises at least one 180-degree pulse.
- [c2] (Original) The method of claim 1, wherein the J modulation is based on a heteronuclear coupling.
- [c3] (Original) The method of claim 2, wherein the heteronuclear coupling is carbon-proton coupling.
- [c4] (Original) The method of claim 3, wherein the J-edit pulse sequence includes a variable delay and the applying and the acquiring are performed a plurality of times to provide a plurality of nuclear magnetic resonance measurements each with a different value for the variable delay.
- [c5] (Original) The method of claim 4, further comprising analyzing amplitudes of the plurality of nuclear magnetic resonance measurements as a function of the variable delay to provide J coupling information or relative abundance of carbon groups.
- [c6] (Original) The method of claim 5, wherein the analyzing comprises solving a set of linear equations or performing a Fourier transformation.
- [c7] (Original) The method of claim 5, further comprising determining types of hydrocarbons present in the fluid sample.
- [c8] (Original) The method of claim 4, further comprising analyzing amplitudes of the plurality of nuclear magnetic resonance measurements to derive a composition of the fluid sample,

wherein the analyzing is performed using a basis set of measurements obtained with standard samples having known compositions.

- [c9] (Original) The method of claim 4, further comprising deriving a J-modulation curve describing amplitudes of the plurality of nuclear magnetic resonance measurements as a function of the variable delay; and comparing the J-modulation curve with a basis set of standard J-modulation curves to derive a composition of the fluid sample, wherein the basis set of the standard J-modulation curves are obtained with standard samples having known compositions.
- [c10] (Original) The method of claim 1, wherein the fluid sample is located in an earth formation.
- [c11] (Original) The method of claim 1, wherein the fluid sample is removed from an earth formation by a formation tester.
- [c12] (Original) The method of claim 4, wherein the nuclear magnetic resonance measurements comprise proton signals.
- [c13] (Original) The method of claim 4, wherein the nuclear magnetic resonance measurements comprise carbon signals.
- [c14] (Original) The method of claim 1, wherein the preparation pulse sequence further comprises a signal enhancement pulse sequence.
- [c15] (Original) The method of claim 14, wherein the signal enhancement pulse sequence is a nuclear Overhauser enhancement pulse sequence or a magnetization transfer pulse sequence.
- [c16] (Original) The method of claim 1, wherein the J-edit pulse sequence includes a gated-decoupling pulse.
- [c17] (Presently Amended, Once) A method for characterizing formation fluids, comprising: disposing a nuclear magnetic resonance instrument in a borehole;

inducing a static magnetic field in a fluid sample in a region of interest, ~~the static magnetic field being primarily inhomogeneous in the fluid sample;~~  
applying an oscillating magnetic field to the fluid sample according to a preparation pulse sequence that comprises a J-edit pulse sequence for developing J modulation; and  
acquiring nuclear magnetic resonance measurements using a detection sequence, wherein the detection sequence comprises at least one 180-degree pulse.

- [c18] (Original) The method of claim 17, wherein the region of interest is in an earth formation.
- [c19] (Original) The method of claim 17, wherein the region of interest is inside the nuclear magnetic resonance instrument.
- [c20] (Original) The method of claim 17, wherein the J-edit pulse sequence includes a variable delay and the applying and the acquiring are performed a plurality of times to provide a plurality of nuclear magnetic resonance measurements each with a different value for the variable delay.
- [c21] (Original) The method of claim 20, further comprising analyzing amplitudes of the plurality of nuclear magnetic resonance measurements as a function of the variable delay to provide J coupling information or relative abundance of carbon groups.
- [c22] (Original) The method of claim 21, further comprising determining hydrocarbon types in the fluid sample.
- [c23] (Original) The method of claim 20, further comprising analyzing amplitudes of the plurality of nuclear magnetic resonance measurements to derive a composition of the fluid sample, wherein the analyzing is performed using a basis set of measurements obtained with standard samples having known compositions.
- [c24] (Original) The method of claim 20, further comprising deriving a J-modulation curve describing amplitudes of the plurality of nuclear magnetic resonance measurements as a function of the variable delay; and comparing the J-modulation curve with a basis set of standard J-modulation curves to derive a composition of the fluid sample, wherein the

basis set of the standard J-modulation curves are obtained with standard samples having known compositions.

- [c25] (Presently Amended, Once) A method for determining ~~with a downhole tool~~ an oil-to-water ratio in a fluid sample, comprising:  
obtaining a nuclear magnetic resonance data set representing protons attached to carbon-13 in the fluid sample;  
deriving a hydrocarbon content from the nuclear magnetic resonance data set, taking into account a natural abundance of carbon-13;  
acquiring a total nuclear magnetic resonance for all protons in the fluid sample, ~~wherein the fluid sample is subject to a primarily inhomogeneous static magnetic field~~;  
deriving a total hydrogen index from the total nuclear magnetic resonance measurement;  
and  
deriving the oil-to-water ratio of the fluid sample from the hydrocarbon content and the total hydrogen index.
- [c26] (Original) The method of claim 25, wherein the nuclear magnetic resonance data set is obtained by subtracting a first proton nuclear magnetic resonance measurement acquired with a J-edit pulse sequence from a second proton nuclear magnetic resonance measurement acquired without a J-edit pulse sequence.
- [c27] (Presently Amended, Once) A nuclear magnetic resonance instrument, comprising:  
a housing adapted to move in a wellbore;  
a magnet disposed in the housing adapted to induce a static magnetic field in a zone of interest, ~~the static magnetic field being primarily inhomogeneous in the zone of interest~~;  
an antenna assembly disposed in the housing, the antenna assembly adapted to induce an oscillating magnetic field in the zone of interest and to receive nuclear magnetic resonance signals; and  
an electronic module including a memory to store instructions for performing a J-edit pulse sequence.

- [c28] (Original) The instrument of claim 27, wherein the housing is adapted to be lowered into the wellbore on an electric cable.
- [c29] (Original) The instrument of claim 27, wherein the housing forms part of a drilling tool assembly.
- [c30] (Original) The instrument of claim 27, wherein the housing forms part of a formation fluid sampling tool.
